## Introduction

---

Motivation: The Cancer Genome Atlas (TCGA) provides us with an enormous collection of data sets, not only spanning a large number of cancers but also a large number of experimental platforms. Even though the data can be accessed and downloaded from the database, the possibility to analyse these downloaded data directly in one single R package has not yet been available.

TCGAbiolinks consists of three parts or levels. Firstly, we provide different options to query and download from TCGA relevant data from all currently platforms and their subsequent pre-processing for commonly used bio-informatics (tools) packages in Bioconductor or CRAN. Secondly, the package allows to integrate different data types and it can be used for different types of analyses dealing with all platforms such as diff.expression, network inference or survival analysis, etc, and then it allows to visualize the obtained results. Thirdly we added a social level where a researcher can found a similar interest in a bioinformatic community, and allows both to find a validation of results in literature in pubmed and also to retrieve questions and answers from site such as support.bioconductor.org, biostars.org, stackoverflow,etc.

This document describes how to search, download and analyze TCGA data using the TCGAbiolinks package.

## TCGAquery: Searching TCGA open-access data

---

You can easily search TCGA samples using the TCGAquery function. Using a summary of filters as used in the TCGA portal, the function works with the following parameters:

- **tumor** Tumor or list of tumors. The list of tumor is shown in the examples.
- **platform** Platform or list of tumors. The list of platforms is shown in the examples.
- **samples** List of TCGA barcodes
- **added.since** (format: mm/dd/YYYY)
- **added.up.to** (format: mm/dd/YYYY)
- **level** Options: 1,2,3,"mage-tab"
- **center**

### Searching by tumor

You can filter the search by tumor using the tumor parameter.

```
query <- TCGAquery(tumor = "gbm")
```

If you don't remember the tumor name, or if you have incorrectly typed it. It will provide you with all the tumor names in TCGA. Also the names can be seen in the help pages ?TCGAquery

```
query <- TCGAquery(tumor = "")
```

```
##
##
## Table: TCGA tumors
##
## -----
## ACC      CNTL   GBM     LAML    LUSC    PCPG    STAD    UCS
## BLCA     COAD   HNSC    LCML    MESO    PRAD    TGCT    UVM
## BRCA     DLBC   KICH    LGG     MISC    READ    THCA    ACC

```

### Searching by level

You can filter the search by level "1", "2", "3" or "mage-tab"

```
query <- TCGAquery(tumor = "gbm", level = 3)
query <- TCGAquery(tumor = "gbm", level = 2)
```

```
query <- TCGAquery(tumor = "gbm", level = 1)
query <- TCGAquery(tumor = "gbm", level = "mage-tab")
```

### Searching by date

You can filter the search by date using the `added.since` and `added.up.to` parameters. For the moment, the format of date accepted is mm/dd/YYYY.

```
# Get all gbm data produced in 2013
query <- TCGAquery(tumor = "gbm", added.since = "01/01/2013", added.up.to = "12/31/2013")
```

### Searching by platform

You can filter the search by platform using the `platform` parameter.

```
query <- TCGAquery(tumor = "gbm", platform = "IlluminaHiSeq_RNASeqV2")
```

If you don't remember the platform, or if you have incorrectly typed it. It will provide you with all the platforms names in TCGA. Also the names can be seen in the help pages `?TCGAquery`

```
query <- TCGAquery(tumor = "gbm", platform = "")

## =====
```

## Searching by samples

You can filter the search by samples using the samples parameter. You can give a list of barcodes or only one barcode. These barcode can be partial barcodes.

# You can define a list of samples to query and download providing relative TCGA barcodes.

```
listSamples <- c("TCGA-E9-A1NG-11A-52R-A14M-07", "TCGA-BH-A1FC-11A-32R-A13Q-07",
  "TCGA-A7-A13G-11A-51R-A13Q-07", "TCGA-BH-A0DK-11A-13R-A089-07",
  "TCGA-E9-A1RH-11A-34R-A169-07", "TCGA-BH-A0AU-01A-11R-A12P-07",
  "TCGA-C8-A1HJ-01A-11R-A13Q-07", "TCGA-A7-A13D-01A-13R-A12P-07",
  "TCGA-A2-A0CV-01A-31R-A115-07", "TCGA-AQ-A0Y5-01A-11R-A14M-07")
```

# Query all available platforms with a list of barcode

```
query <- TCGAquery(samples = listSamples)
```

# Query with a partial barcode

```
query <- TCGAquery(samples = "TCGA-61-1743-01A")
```

## Examples

Some search examples are shown below:

```
query <- TCGAquery(tumor = "gbm", added.since = "01/01/2013", added.up.to = "12/31/2013")
```

```
query <- TCGAquery(tumor = c("gbm", "lgg"),
```

```
platform = c("HumanMethylation450", "HumanMethylation27"))

query <- TCGAquery(tumor = "gbm", platform = "HumanMethylation450", level = "3")

query <- TCGAquery(samples = "TCGA-61-1743-01A-01D")

query <- TCGAquery(samples = "TCGA-61-1743-01A-01D-0649-04", level = 3)

query <- TCGAquery(samples = "TCGA-61-1743-01A-01D-0649-04",
  tumor = "OV", platform = "CGH-1x1M_G4447A")
```

## TCGAintegrate: Summary of the common numbers of patient samples in different platforms

Some times researches would like to use samples from different platforms from the same patient. In order to help the user to have an overview of the number of samples in commun we created the function TCGAintegrate that will receive the data frame returned from TCGAquery and produce a matrix n platforms x n platforms with the values of samples in commun.

Some search examples are shown below

```
query <- TCGAquery(tumor = "brca", level = 3)
matSamples <- TCGAintegrate(query)
```

The result of the 3 platforms of TCGAintegrate result is shown below:

Table 1: Table common samples among platforms from TCGAquery

	AgilentG4502A_07_3	HumanMethylation450	IlluminaHiSeq_RNASeqV2
AgilentG4502A_07_3	604	224	530
HumanMethylation450	224	913	775
IlluminaHiSeq_RNASeqV2	530	775	1218

## TCGAquery\_version: Summary versions of the data in TCGA

Query version for a specific platform for example IlluminaHiSeq\_RNASeqV2

```
library(TCGAbiolinks)
```

```
BRCA_RNASeqV2_version <- TCGAquery_Version(tumor = "brca",
  platform = "illuminaHiSeq_rnaseqv2")
```

The result is shown below:

Table 2: Table with version, number of samples and size (Mbyte) of BRCA IlluminaHiSeq\_RNASeqV2 Level 3

Version	Date	Samples	SizeMbyte
unc.edu_BRCA.IlluminaHiSeq_RNASeqV2.Level_3.1.11.0/	2015-01-28 03:16	1218	1740.6

## TCGAdownload: Downloading open-access data

You can easily download data using the TCGAdownload function.

The arguments are:

- **data** The TCGAquery output
- **path** location to save the files. Default: "."
- **type** Filter the files to download by type
- **samples** List of samples to download
- **force** Download again if file already exists? Default: FALSE

### Example of use

```
# get all samples from the query and save them in the TCGA folder
# samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results
# samples to normalize later
```

```
TCGAdownload(query, path = "data", type = "rsem.genes.results")
```

```
TCGAdownload(query, path = "data", type = "rsem.isoforms.normalized_results")
```

```
TCGAdownload(query, path = "dataBrca", type = "rsem.genes.results",
  samples = c("TCGA-E9-A1NG-11A-52R-A14M-07",
    "TCGA-BH-A1FC-11A-32R-A13Q-07")
)
```

Comment: The function will structure the folders to save the data as: *Path given by the user/Experiment folder*

### Table of types available for downloading

- **RNASeqV2:** junction\_quantification, rsem.genes.results, rsem.isoforms.results, rsem.genes.normalized\_results, rsem.isoforms.normalized\_results, bt.exon\_quantification
- **RNASeq:** exon\_quantification, spljxn\_quantification, gene\_quantification
- **genome\_wide\_snp\_6:** hg18.seg, hg19.seg, nocnv\_hg18.seg, nocnv\_hg19.seg

## TCGAppeare: Preparing the data

---

You can easily read the downloaded data using the TCGAppeare function. This function will prepare the data into a [SummarizedExperiment](#) (Huber, Wolfgang and Carey, Vincent J and Gentleman, Robert and Anders, Simon and Carlson, Marc and Carvalho, Benilton S and Bravo, Hector Corrada and Davis, Sean and Gatto, Laurent and Girke, Thomas and others 2015) object for downstream analysis. For the moment this function is working only with data level 3.

The arguments are:

- **query** Data frame as the one returned from TCGAquery
- **dir** Directory with the files
- **type** File to prepare.
- **save** Save a rda object with the prepared object? Default: FALSE
- **filename** Name of the rda object that will be saved if save is TRUE
- **toPackage** Name of the package to prepare the data specific to that package.
- **summarizedExperiment** Should the output be a SummarizedExperiment object? Default: TRUE

### Example of use

```
# get all samples from the query and save them in the TCGA folder
# samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results
# samples to normalize later
data <- TCGAppeare(query, dir = "data", save = TRUE, filename = "myfile.rda")
```

As an example, for the platform IlluminaHiSeq\_RNASeqV2 we prepared two samples (TCGA-DY-A1DE-01A-11R-A155-07 and TCGA-DY-A0XA-01A-11R-A155-07) for the rsem.genes.normalized\_results type. In order to create the object mapped the gene\_id to the hg19. The genes\_id not found are then removed from the final matrix. The default output is a SummarizedExperiment is shown below.

```
data
## class: RangedSummarizedExperiment
## dim: 19947 2
## metadata(0):
## assays(1): raw_counts
## rownames(19947): A1BG|1 A2M|2 ... TMED7-TICAM2|100302736
## LOC100303728|100303728
## rowRanges metadata column names(2): gene_id entrezgene
## colnames(2): TCGA-DY-A1DE-01A-11R-A155-07
## TCGA-DY-A0XA-01A-11R-A155-07
## colData names(3): sample shortLetterCode definition
head(assay(data,"raw_counts"))

##           TCGA-DY-A1DE-01A-11R-A155-07 TCGA-DY-A0XA-01A-11R-A155-07
## A1BG|1                13.6732                13.0232
## A2M|2                 5030.4792                1461.9358
## NAT1|9                 70.5969                 61.1727
## NAT2|10                13.7272                 44.4892
## SERPINA3|12            62.7528                 40.4447
## AADAC|13                1.4708                 1.0111
```

In order to create the SummarizedExperiment object we mapped the rows of the experiments into GRanges. In order to map miRNA we used the miRNA from the anotation database TxDb.Hsapiens.UCSC.hg19.knownGene, this will exclude the miRNA from viruses and bacteria. In order to map genes, genes alias, we used the biomaRt hg19 database (hsapiens\_gene\_ensembl from grch37.ensembl.org).

In case you prefer to have the raw data. You can get a data frame without any modification setting the `summarizedExperiment` to `false`.

```
class(data)
## [1] "data.frame"

dim(data)
## [1] 20531      2

head(data)
##           TCGA-DY-A1DE-01A-11R-A155-07 TCGA-DY-AOXA-01A-11R-A155-07

## ?|136542                 0.0000                0.0000
```

### Table of types available for the TCGAprepare

- **RNASeqV2:** `junction_quantification`, `rsem.genes.results`, `rsem.isoforms.results`, `rsem.genes.normalized_results`, `rsem.isoforms.normalized_results`, `bt.exon_quantification`
- **RNASeq:** `exon_quantification`, `spljxn_quantification`, `gene_quantification`
- **genome\_wide\_snp\_6:** `hg18.seg`, `hg19.seg`, `nocnv_hg18.seg`, `nocnv_hg19.seg`

### Preparing the data with TCGAprepare - toPackage

This section will show how to integrate TCGAbiolinks with other packages. Our intention is to provide as many integrations as possible.

The example below shows how to use TCGAbiolinks with ELMER package (expression/methylation analysis). The TCGAprepare for the methylation data will remove probes with NA values in more than 0.80% samples and remove the annotation data, for the expression data it will take the  $\log_2(\text{expression} + 1)$  of the expression matrix in order to linearize the relation between methylation and expression. Also it will prepare the rownames as specified by the package.

```
##### Get tumor samples with TCGAbiolinks
library(TCGAbiolinks)
query <- TCGAquery(tumor = "GBM", level = 3, platform = "HumanMethylation450")
# This function will take a lot of time depends on internet connection
TCGAdownload(query, path = "TCGA/450k")
met <- TCGAprepare(query, dir = "TCGA/450k",
  save = TRUE,
  filename = "met.rda",
  toPackage = "ELMER")

query.rna <- TCGAquery(tumor="GBM", level=3, platform="IlluminaHiSeq_RNASeqV2")
TCGAdownload(query.rna, path="TCGA/rna", type = "rsem.genes.normalized_results")
exp <- TCGAprepare(query.rna, dir="TCGA/rna", save = TRUE,
  filename = "exp.rda", toPackage = "ELMER")

##### To ELMER
library(ELMER)
```

```
##### gene annotation
geneAnnot <- txs()
geneAnnot$GENEID <- paste0("ID",geneAnnot$GENEID)
geneInfo <- promoters(geneAnnot,upstream = 0, downstream = 0)
##### probe
probe <- get.feature.probe()

mee.gbm.glial.with.exp <- fetch.mee(meth = gbm.glial.m,
                                   exp = exp,
                                   probeInfo = probe,
                                   TCGA = TRUE,
                                   geneInfo = geneInfo)
```

## Examples TCGAquery, TCGAdownload, TCGAprepare

---

### Gene Expression IlluminaHiSeq\_RNASeq

You can easily search TCGA samples, download and prepare a matrix of gene expression.

```
# Query platform IlluminaHiSeq_RNASeq withot a list of barcode
query <- TCGAquery(tumor = "brca", platform = "IlluminaHiSeq_RNASeq", level = "3")

# You can define a list of samples to query and download providing relative TCGA barcodes.
listSamples <- TCGAquery_samplesfilter(query)

# Download only first 5 samples for test.

TCGAdownload(query, path = "dataBrca", type = "gene.quantification",
             samples = listSamples$IlluminaHiSeq_RNASeq[1:5])

# Prepare expression matrix with gene id in rows and samples (barcode) in columns
# rsem.genes.results as values
BRCAMatrix <- TCGAprepare(query,"dataBrca",type = "gene.quantification")
```

### Gene Expression IlluminaHiSeq\_RNASeqV2

You can easily search TCGA samples, download and prepare a matrix of gene expression.

```
# You can define a list of samples to query and download providing relative TCGA barcodes.

listSamples <- c("TCGA-E9-A1NG-11A-52R-A14M-07","TCGA-BH-A1FC-11A-32R-A13Q-07",
                "TCGA-A7-A13G-11A-51R-A13Q-07","TCGA-BH-A0DK-11A-13R-A089-07",
                "TCGA-E9-A1RH-11A-34R-A169-07","TCGA-BH-A0AU-01A-11R-A12P-07",
                "TCGA-C8-A1HJ-01A-11R-A13Q-07","TCGA-A7-A13D-01A-13R-A12P-07",
                "TCGA-A2-A0CV-01A-31R-A115-07","TCGA-AQ-A0Y5-01A-11R-A14M-07")

# Query platform IlluminaHiSeq_RNASeqV2 with a list of barcode
query <- TCGAquery(tumor = "brca", samples = listSamples,
                  platform = "IlluminaHiSeq_RNASeqV2", level = "3")

# dont run
#TCGAdownload(query, path = "dataBrca", type = "gene.quantification",samples = listSamples)
```

```

# Download a list of barcodes with platform IlluminaHiSeq_RNASeqV2
TCGAdownload(query, path = "../dataBrca", type = "rsem.genes.results", samples = listSamples)

# Prepare expression matrix with gene id in rows and samples (barcode) in columns
# rsem.genes.results as values
BRCARnaseq_assay <- TCGAprepare(query, "../dataBrca", type = "rsem.genes.results")

BRCAMatrix <- assay(BRCARnaseq_assay, "raw_counts")

# For gene expression if you need to see a boxplot correlation and AAIC plot
# to define outliers you can run

BRCARnaseq_CorOutliers <- TCGAanalyze_Preprocessing(BRCARnaseq_assay)

```

The result is shown below:

Table 3: Example of a n  
7 samples in columns)

	TCGA-C8-A1HJ-01A-11R-A13Q-07	TCGA-E9-A1NG-11A-52R-A14M-07	TCGA-A7-A13D-01A-13R-A12P-07

The result from TCGAanalyze\_Preprocessing is shown below:

## CNV

You can easily search TCGA samples, download and prepare a matrix of gene expression.

# Define a list of samples to query and download providing relative TCGA barcodes.

```
samplesList <- c("TCGA-02-0046-10A-01D-0182-01",
  "TCGA-02-0052-01A-01D-0182-01",
  "TCGA-02-0033-10A-01D-0182-01",
  "TCGA-02-0034-01A-01D-0182-01",
  "TCGA-02-0007-01A-01D-0182-01")
```

# Query platform Genome\_Wide\_SNP\_6 with a list of barcode

```
query <- TCGAquery(tumor = "gbm", level = 3, platform = "Genome_Wide_SNP_6")
```

# Download a list of barcodes with platform Genome\_Wide\_SNP\_6

```
TCGAdownload(query, path = "samples")
```

# Prepare matrix

```
GBM_CNV <- TCGAprepare(query, dir = "samples", type = ".hg19.seg.txt")
```

## TCGAquery\_clinic & TCGAquery\_clinicFilt: Working with clinical data

You can retrieve clinical data using the clinic function. The parameters of this function are:

- cancer ("OV", "BRCA", "GBM", etc)
- clinical\_data\_type ("clinical\_patient", "clinical\_drug", etc)

A full list of cancer and clinical data type can be found in the help of the function.

```
# Get clinical data
clinical_brca_data <- TCGAquery_clinic("brca","clinical_patient")
clinical_uvm_data_bio <- TCGAquery_clinic("uvm","biospecimen_normal_control")
clinical_brca_data_bio <- TCGAquery_clinic("brca","biospecimen_normal_control")
clinical_brca_data <- TCGAquery_clinic("brca","clinical_patient")
```

Also, some functions to work with clinical data are provided. For example the function `TCGAquery_clinicFilt` will filter your data, returning the list of barcodes that matches all the filter.

The parameters of `TCGAquery_clinicFilt` are:

- **barcode** List of barcodes
- **clinical\_patient\_data** clinical patient data obtained with clinic function Ex: `clinical_patient_data <- TCGAquery_clinic("LGG","clinical_patient")`
- **HER** her2 neu immunohistochemistry receptor status: "Positive" or "Negative"
- **gender** "MALE" or "FEMALE"
- **PR** Progesterone receptor status: "Positive" or "Negative"
- **stage** Pathologic Stage: "stage\_IX", "stage\_I", "stage\_IA", "stage\_IB", "stage\_IIX", "stage\_IIA", "stage\_IIB", "stage\_IIIX", "stage\_IIIA", "stage\_IIIB", "stage\_IIIC", "stage\_IV" -
- **ER** Estrogen receptor status: "Positive" or "Negative"

```
bar <- c("TCGA-G9-6378-02A-11R-1789-07", "TCGA-CH-5767-04A-11R-1789-07",

## TCGA Downstream Analysis

---

After preparing the gene expression from TCGA data using the `TCGAprepare` function, you can do a normalization of genes using the function `TCGAanalyze_Normalization`, do a quantile filter of genes with the `TCGAanalyze_Filtering` function. Also, in order to classify your samples (barcode) you can use the `TCGAquery_SampleTypes` function, the typeSample "NT" will return the "Solid Tissue Normal" samples, while the typeSample "TP" will return "Primary Solid Tumor" samples.

```
# Downstream analysis using gene expression data
# TCGA samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results

library(TCGAbiolinks)

# dataBRCA in TCGAbiolinks package is a table from TCGA BRCA [10 samples] and comes from
# BRCAMatrix <- TCGAprepare(query,"dataBrca") from above example
# dataBRCA <- BRCAMatrix

# normalization of genes
dataNorm <- TCGAbiolinks::TCGAanalyze_Normalization(dataBRCA, geneInfo)

# quantile filter of genes
dataFilt <- TCGAanalyze_Filtering(dataNorm, 0.25)

# selection of normal samples "NT"
samplesNT <- TCGAquery_SampleTypes(colnames(dataFilt), typesample = c("NT"))

# selection of tumor samples "TP"
samplesTP <- TCGAquery_SampleTypes(colnames(dataFilt), typesample = c("TP"))
```

## TCGAanalyze\_DEA & TCGAanalyze\_LevelTab Differential expression analysis (DEA)

Perform DEA (Differential expression analysis) to identify differentially expressed genes (DEGs) using the `TCGAanalyze_DEA` function. This function receives as parameters:

- **mat1** The matrix of the first group (in the example group 1 is the normal samples),
- **mat2** The matrix of the second group (in the example group 2 is tumor samples)
- **Cond1type** Label for group 1
- **Cond2type** Label for group 2

After, we filter the output of dataDEGs by  $\text{abs}(\text{LogFC}) \geq 1$ , and uses the `TCGAanalyze_LevelTab` function to create a table with DEGs (differentially expressed genes), log Fold Change (FC), false discovery rate (FDR), the gene expression level for samples in Cond1type, and Cond2type, and Delta value (the difference of gene expression between the two conditions multiplied logFC).

```
# Downstream analysis using gene expression data
# TCGA samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results
# save(dataBRCA, geneInfo , file = "dataGeneExpression.rda")
library(TCGAbiolinks)

# Diff.expr.analysis (DEA)
dataDEGs <- TCGAanalyze_DEA(dataFilt[,samplesNT], dataFilt[,samplesTP],
                             "Normal", "Tumor")

# DEGs filter by abs(logFC) >=1
dataDEGsFilt <- dataDEGs[abs(dataDEGs$logFC) >= 1,]

# DEGs table with expression values in normal and tumor samples
dataDEGsFiltLevel <- TCGAanalyze_LevelTab(dataDEGsFilt,"Tumor","Normal",
                                           dataFilt[,samplesTP],dataFilt[,samplesNT])
```

The result is shown below:

Table 4: Table DEGs after DEA

## TCGAanalyze\_EAcomplete & TCGAvisualize\_EAbarplot: Enrichment Analysis

Researchers, in order to better understand the underlying biological processes, often want to retrieve a functional profile of a set of genes that might have an important role. This can be done by performing an enrichment analysis.

We will perform an enrichment analysis on gene sets using the `TCGAanalyze_EAcomplete` function. Given a set of genes that are up-regulated under certain conditions, an enrichment analysis will find identify classes of genes or proteins that are over-represented using annotations for that gene set.

To view the results you can use the `TCGAvisualize_EAbarplot` function as shown below.

```
library(TCGAbiolinks)
# Enrichment Analysis EA
# Gene Ontology (GO) and Pathway enrichment by DEGs list
```

```

Genelist <- rownames(dataDEGsFiltLevel)

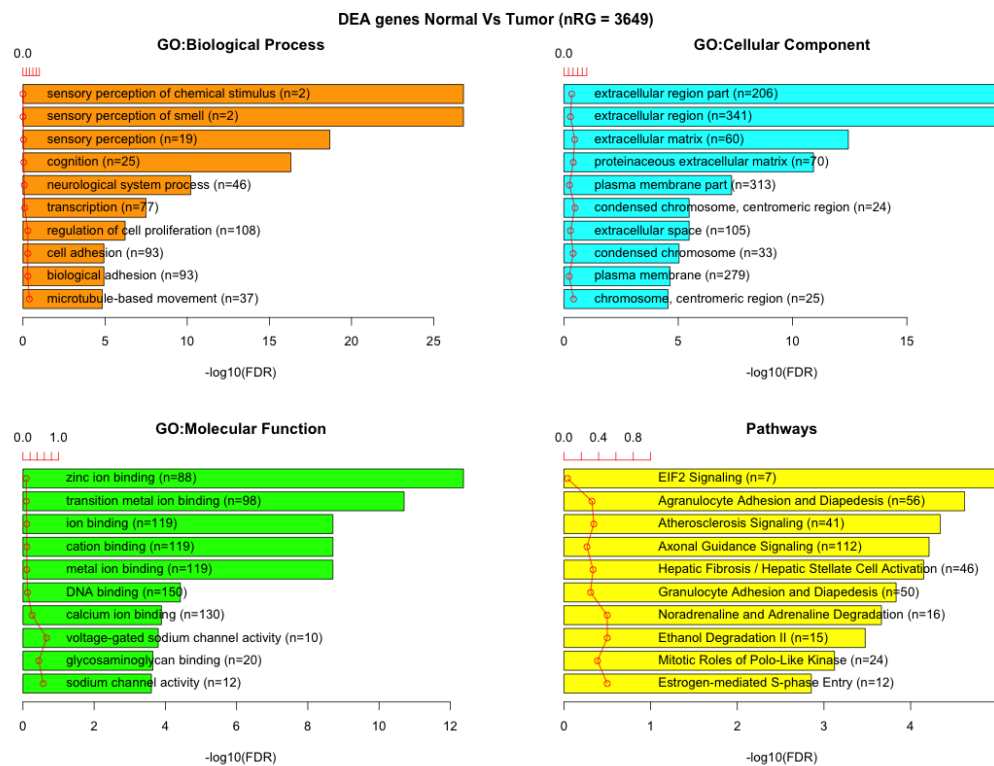

system.time(ansEA <- TCGAanalyze_EAcomplete(TFname="DEA genes Normal Vs Tumor",Genelist))

# Enrichment Analysis EA (TCGAVisualize)
# Gene Ontology (GO) and Pathway enrichment barPlot

TCGAVisualize_EAbarplot(tf = rownames(ansEA$ResBP),
  GOBPTab = ansEA$ResBP,
  GOCCTab = ansEA$ResCC,
  GOMFTab = ansEA$ResMF,
  PathTab = ansEA$ResPat,
  nRGTab = Genelist,
  nBar = 10)

```

The result is shown below:

## TCGAVisualize\_PCA: Principal Component Analysis plot for differentially expressed genes

In order to understand better our genes, we can perform a PCA to reduce the number of dimensions of our gene set. The function TCGAVisualize\_PCA will plot the PCA for different groups.

The parameters of this function are:

- **dataFilt** The expression matrix after normalization and quantile filter
- **dataDEGsFiltLevel** The TCGAanalyze\_LevelTab output
- **ntopgenes** number of DEGs genes to plot in PCA

```
library(TCGAbiolinks)
```

```
# normalization of genes
```

```

dataNorm <- TCGAbiolinks::TCGAanalyze_Normalization(dataBRCA, geneInfo)

# quantile filter of genes
dataFilt <- TCGAanalyze_Filtering(dataNorm, 0.25)

# Principal Component Analysis plot for ntop selected DEGs
TCGAvisualize_PCA(dataFilt, dataDEGsFiltLevel, ntopgenes = 200)

# boxplot of normalized data
#sampleGenes <- rownames(dataDEGsFilt[dataDEGsFilt$logFC >=1,])[1:20]
#boxplot(log(dataBRCA[sampleGenes,]), las = 2)
#boxplot(log(dataFilt[sampleGenes,]), las = 2)

```

The result is shown below:

PCA top 200 Up and down diff.expr genes between Normal vs Tumor

## Survival Analysis: TCGAanalyze\_survival, Cox Regression and dnet package

When analyzing survival times, different problems come up than the ones discussed so far. One question is how do we deal with subjects dropping out of a study. For example, assume that we test a new cancer drug. While some subjects die, others may believe that the new drug is not effective, and decide to drop out of the study before the study is finished. A similar problem would be faced when we investigate how long a machine lasts before it breaks down.

Using the clinical data, it is possible to create a survival plot with the function `TCGAanalyze_survival` as follows:

```

# survival using the column group
clinical <- TCGAquery_clinic("gbm", "clinical_patient")
TCGAanalyze_survival(clinical, "gender")

```

The arguments of `TCGAanalyze_survival` are:

- **clinical\_patient** TCGA Clinical patient with the information days\_to\_death
- **clusterCol** Column with groups to plot. This is a mandatory field, the caption will be based in this column

- **legend** Legend title of the figure
- **cutoff** xlim This parameter will be a limit in the x-axis. That means, that patients with `days_to_deth > cutoff` will be set to Alive.
- **main** main title of the plot
- **ylab** y-axis text of the plot
- **xlab** x-axis text of the plot
- **filename** The name of the pdf file
- **color** Define the colors of the lines.

The result is shown below:

```
## Warning in readPNG("survival.png"): libpng warning: iCCP: profile 'icc':
## Oh: PCS illuminant is not D50
```

```
library(TCGAbiolinks)
# Survival Analysis SA

clinical_patient_Cancer <- TCGAquery_clinic("brca","clinical_patient")

## TCGA downstream methylation analysis

Some downstream analysis from methylation data can be done with TCGAbiolinks. An example is shown below. Firstly, we search, download and prepare data from the HumanMethylation450 platform for the GBM tumor and also get the clinical information from the patients. In this step, we will have a SummarizedExperiment object, where the rows are the probes and the columns the samples. For more information about this object you can take a look in the documentation with the command `?SummarizedExperiment`.

```
library(TCGAbiolinks)

# Getting the data
query <- TCGAquery(tumor = "gbm", platform = "HumanMethylation450", level = 3)
TCGAdownload(query,path=".")
data <- TCGAprepare(query = query,dir = ".",save = T)
clinical <- TCGAquery_clinic("gbm","clinical_patient")

#Preprocessing
## We will remove probes with NA level
data <- subset(data,subset=(rowSums(is.na(assay(data))))==0))

# For the analysis we remove X and Y chromosome, because gender
# should not influentiate the analysis
# We will remove the rs probes that should not be used in the methylation analysis
idx <- !(grepl("chrX|chrY|chrNA",as.vector(seqnames(data))))
data <- subset(data,subset=idx)
```

As an example, we divided the data into groups in order to analyze the data.

```
# random split of patients into groups
clinical$group <- c(rep("group1",nrow(clinical)/4),
```

```
rep("group2",nrow(clinical)/4),
rep("group3",nrow(clinical)/4),
rep("group4",nrow(clinical)-3*(floor(nrow(clinical)/4))))

colData(data)$group <- c(rep("group1",ncol(data)/2), rep("group2",ncol(data)/2))
```

## TCGAvisualize\_meanMethylation: Mean Methylation Analysis

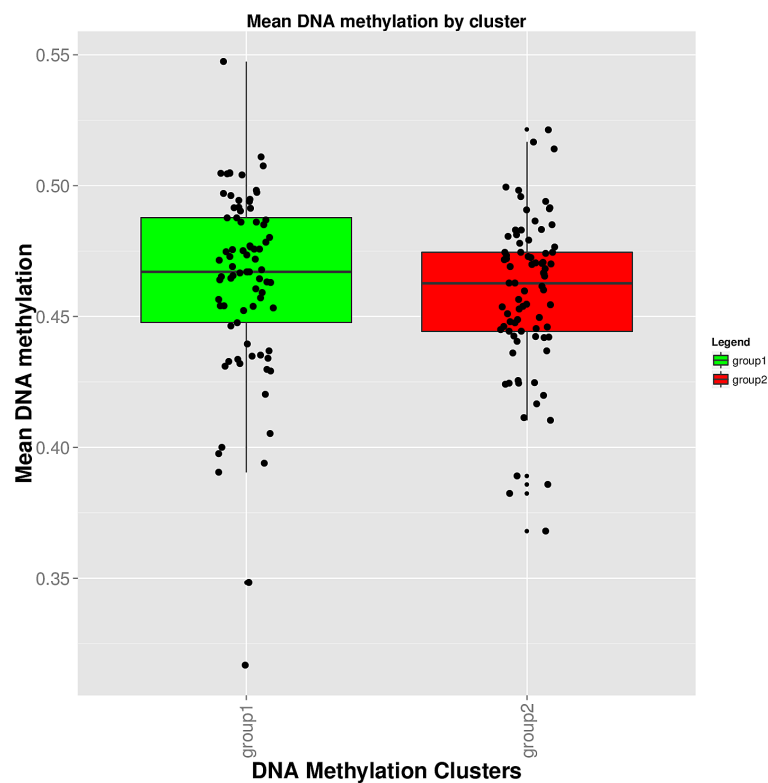

Using the data and calculating the mean methylation per group, it is possible to create a mean methylation boxplot with the function `TCGAvisualize_meanMethylation` as follows:

```
TCGAvisualize_meanMethylation(data,"group")
```

The arguments of `TCGAvisualize_meanMethylation` are:

- **data** SummarizedExperiment object obtained from `TCGApipeline`
- **groupCol** Columns in `colData(data)` that defines the groups. If no columns defined a columns called "Patients" will be used
- **sort** Sort by mean methylation? False by default
- **filename** The name of the pdf that will be save
- **legend** Legend title of the figured
- **ylab** y-axis text of the plot
- **xlab** x-axis text of the plot
- **filename** The name of the pdf file
- **color** Define the colors of the lines.

The result is shown below:

## TCGAanalyze\_DMR: Differentially methylated regions Analysis

We will search for differentially methylated CpG sites using the `TCGAanalyze_DMR` function. In order to find these regions we use the beta-values (methylation values ranging from 0.0 to 1.0) to compare two groups.

Firstly, it calculates the difference between the mean methylation of each group for each probes.

Secondly, it calculates the p-value using the wilcoxon test adjusting by the Benjamini-Hochberg method. The default parameters was set to require a minimum absolute beta-values difference of 0.2 and a p-value adjusted of  $< 0.01$ .

After these analysis, we save a volcano plot (x-axis:diff mean methylation, y-axis: significance) that will help the user identify the differentially methylated CpG sites and return the object with the calculus in the `rowRanges`.

```
data <- TCGAanalyze_DMR(data,groupCol="group")
```

Volcano plot saved and the given data with the results (`diffmean.group1.group2`, `p.value.group1.group2`, `p.value.adj.group1.group2`, `status.group1.group2`) in the `rowRanges` where `group1` and `group2` are the names of the groups

The output will be an graph such as the figure below. Also, the `TCGAanalyze_DMR` function will return the Summarized-Experiment with the values of p-value, p-value adjusted, diffmean and the group it belongs in the graph (non significant, hypomethylated, hypermethylated). This values can be view/accesed using the `rowRanges` accesesor.

The arguments of `volcanoPlot` are:

- **data** SummarizedExperiment object obtained from `TCGAprepare`
- **groupCol** Columns in `colData(data)` that defines the groups. If no columns defined a columns called "Patients" will be used
- **group1** In case our object has more than 2 groups, you should set the name of the group
- **group2** In case our object has more than 2 groups, you should set the name of the group
- **filename** The name of the pdf that will be save
- **legend** Legend title of the figured
- **ylab** y-axis text of the plot
- **xlab** x-axis text of the plot
- **filename** The name of the pdf file
- **color** Define the colors of the lines.
- **label** vector of labels to be used in the figure
- **xlim** x limits to cut image
- **ylim** y limits to cut image
- **p.cut** p values threshold
- **diffmean.cut** diffmean threshold
- **paired** Wilcoxon paired parameter
- **adj.method** Adjusted method for the p-value calculation

### TCGAvisualize\_starburst: Analyzing expression and methylation together

The starburst plot is proposed to combine information from two volcano plots, and is applied for a study of DNA methylation and gene expression. In order to reproduce this plot, we will use the `TCGAvisualize_starburst` function.

The function creates Starburst plot for comparison of DNA methylation and gene expression. The  $\log_{10}$  (FDR-corrected P value) is plotted for beta value for DNA methylation (x axis) and gene expression (y axis) for each gene. The black dashed line shows the FDR-adjusted P value of 0.01.

The parameters of this function are:

- **met** SummarizedExperiment with methylation data obtained from the `TCGApipeline` and processed by `volcanoAnalysis` function. Expected colData columns: `diffmean`, `p.value.adj` and `p.value`
- **exp** SummarizedExperiment with methylation data obtained from the `TCGApipeline` function and processed by `TCGAanalyze_DEA` function. Expected colData columns: `diffmean`, `p.value.adj` and `p.value`
- **group1** Name of the group1
- **group2** Name of the group2

```

## TCGAsocial: Searching questions, answers and literature

The TCGAsocial function has two type of searches, one that searches for most downloaded packages in CRAN or BioConductor and one that searches the most related question in biostar.

### TCGAsocial with BioConductor

Find most downloaded packages in CRAN or BioConductor

```
library(TCGAbiolinks)
```

```
# Define a list of package to find number of downloads
```

```
listPackage <-c("limma","edgeR","survcomp")
```

```
tabPackage <- TCGAsocial(siteToFind ="bioconductor.org",listPackage)
```

```
# define a keyword to find in support.bioconductor.org returning a table with suggested packages
```

```
tabPackageKey <- TCGAsocial(siteToFind ="support.bioconductor.org" ,KeyInfo = "tcga")
```

The result is shown below:

Table 7: Table with number of downloads about a list of packages

Package	NumberDownload
limma	71879
edgeR	34650
survcomp	3856

Table 8: Find most related question in support.bioconductor.org with keyword = tcga

question	BiostarsSite	PackageSuggested
A: Calculating Ibd Using R Package	/55481/	TIN
A: Mirna Seq Blood Time Course Data Without Replicate And Paired Control	/96836/	timecourse
A: How Can I Use Geo To Understand The Regulation Of My Gene?	/14513/	SIM;TIN
A: How To Identify Rotamer States From A Pdb ?	/96579/	SIM
A: Pathway Analysis In R	/14316/	sigPathway
A: Constructing A Nj Tree From A Binary Matrix With 11 Taxa And 370.000 Characters.	/54599/	sigPathway
A: Ngs Question ~ Consensus	/17535/	sigPathway
A: Is There An R Library Similar To Libraries Like Bioperl, Biopython Or Bioruby (	/17287/	sigPathway

A: r3Cseq rat genome	/135732	0

### TCGAsocial with Biostar

Find most related question in biostar.

```
library(TCGAbiolinks)
```

```
# Find most related question in biostar with TCGA
```

```
tabPackage1 <- TCGAsocial(siteToFind ="biostars.org",KeyInfo = "TCGA")
```

```
# Find most related question in biostar with package
```

```
tabPackage2 <- TCGAsocial(siteToFind ="biostars.org",KeyInfo = "package")
```

The result is shown below:

Table 9: Find most related question in biostar with TCGA

question	BiostarsSite	PackageSuggested
A: Question About Tcga Snp-Array Data	/88541/	LEA;PROcess;ROC
A: Cnv Data	/95763/	DNAcopy;HELP
A: Cnv Data	/95763/	DNAcopy;HELP
