# Introduction

Motivation: The Cancer Genome Atlas (TCGA) provides us with an enormous collection of data sets, not only spanning a large number of cancers but also a large number of experimental platforms. Even though the data can be accessed and downloaded from the database, the possibility to analyse these downloaded data directly in one single R package has not yet been available.

TCGAbiolinks consists of three parts or levels. Firstly, we provide different options to query and download from TCGA relevant data from all currently platforms and their subsequent pre-processing for commonly used bio-informatics (tools) packages in Bioconductor or CRAN. Secondly, the package allows to integrate different data types and it can be used for different types of analyses dealing with all platforms such as diff.expression, network inference or survival analysis, etc, and then it allows to visualize the obtained results. Thirdly we added a social level where a researcher can found a similar intereset in a bioinformatic community, and allows both to find a validation of results in literature in pubmed and also to retrieve questions and answers from site such as support.bioconductor.org, biostars.org, stackoverflow,etc.

This document describes how to search, download and analyze TCGA data using the TCGAbiolinks package.

# TCGAquery: Searching TCGA open-access data

You can easily search TCGA samples using the TCGAquery function. Using a summary of filters as used in the TCGA portal, the function works with the following parameters:

- tumor Tumor or list of tumors. The list of tumor is shown in the examples.
- platform Platform or list of tumors. The list of platforms is shown in the examples.
- samples List of TCGA barcodes
- added.since (format: mm/dd/YYYY)
- added.up.to (format: mm/dd/YYYY)
- level Options: 1,2,3,"mage-tab"
- center

#### Searching by tumor

You can filter the search by tumor using the tumor parameter.

```
query <- TCGAquery(tumor = "gbm")</pre>
```

If you don't remember the tumor name, or if you have incorrectly typed it. It will provide you with all the tumor names in TCGA. Also the names can be seen in the help pages ?TCGAquery

```
query <- TCGAquery(tumor = "")</pre>

## ERROR: Disease not found. Select from the table above.
 _____
```

#### Searching by level

```
You can filter the search by level "1", "2", "3" or "mage-tab" query <- TCGAquery(tumor = "gbm", level = 3) query <- TCGAquery(tumor = "gbm", level = 2)
```

```
query <- TCGAquery(tumor = "gbm", level = 1)
query <- TCGAquery(tumor = "gbm", level = "mage-tab")</pre>
```

#### Searching by date

You can filter the search by date using the added.since and added.up.to parameters. For the moment, the format of date accepted is mm/dd/YYYY.

```
# Get all gbm data produced in 2013
query <- TCGAquery(tumor = "gbm", added.since = "01/01/2013", added.up.to = "12/31/2013")</pre>
```

#### Searching by platform

You can filter the search by platform using the platform parameter.

```
query <- TCGAquery(tumor = "gbm", platform = "IlluminaHiSeq_RNASeqV2")
```

If you don't remember the platform, or if you have incorrectly typed it. It will provide you with all the platforms names in TCGA. Also the names can be seen in the help pages ?TCGAquery

```
query <- TCGAquery(tumor = "gbm", platform = "")</pre>

#### Searching by center

#### **Searching by samples**

query <- TCGAquery(tumor = c("gbm","lgg"),</pre>

You can filter the search by samples using the samples parameter. You can give a list of barcodes or only one barcode. These barcode can be partial barcodes.

```
platform = c("HumanMethylation450","HumanMethylation27"))
query <- TCGAquery(tumor = "gbm", platform = "HumanMethylation450", level = "3")
query <- TCGAquery(samples = "TCGA-61-1743-01A-01D")
query <- TCGAquery(samples = "TCGA-61-1743-01A-01D-0649-04", level = 3)
query <- TCGAquery(samples = "TCGA-61-1743-01A-01D-0649-04", tumor = "0V", platform = "CGH-1x1M_G4447A")</pre>
```

# TCGAintegrate: Summary of the common numbers of patient samples in different platforms

Some times researches would like to use samples from different platforms from the same patient. In order to help the user to have an overview of the number of samples in commun we created the function TCGAintegrate that will receive the data frame returned from TCGAquery and produce a matrix n platforms x n platforms with the values of samples in commum.

```
Some search examples are shown below
```

```
query <- TCGAquery(tumor = "brca",level = 3)
matSamples <- TCGAintegrate(query)</pre>
```

The result of the 3 platforms of TCGAintegrate result is shown below:

Table 1: Table common samples among platforms from TCGAquery

	AgilentG4502A_07_3	HumanMethylation450	IlluminaHiSeq_RNASeqV2
AgilentG4502A_07_3	604	224	530
HumanMethylation450	224	913	775
IIIuminaHiSeq_RNASeqV2	530	775	1218

# TCGAquery\_version: Summary versions of the data in TCGA

Query version for a specific platform for example IlluminaHiSeq\_RNASeqV2 library(TCGAbiolinks)

Table 2: Table with version, number of samples and size (Mbyte) of BRCA IlluminaHiSeq RNASeqV2 Level 3

Version	Date	Samples	SizeMbyte

# TCGAdownload: Downloading open-access data

You can easily download data using the TCGAdownload function.

The arguments are:

- data The TCGAquery output
- path location to save the files. Default: "."
- type Filter the files to download by type
- samples List of samples to download
- force Download again if file already exists? Default: FALSE

#### **Example of use**

Comment: The function will structure the folders to save the data as: Path given by the user/Experiment folder

#### Table of types available for downloading

- RNASeqV2: junction\_quantification,rsem.genes.results, rsem.isoforms.results, rsem.genes.normalized\_results, rsem.isoforms.normalized\_results, bt.exon\_quantification
- **RNASeq:** exon.quantification,spljxn.quantification, gene.quantification
- **genome\_wide\_snp\_6:** hg18.seg,hg19.seg,nocnv\_hg18.seg,nocnv\_hg19.seg

# TCGAprepare: Preparing the data

You can easily read the downloaded data using the TCGAprepare function. This function will prepare the data into a SummarizedExperiment (Huber, Wolfgang and Carey, Vincent J and Gentleman, Robert and Anders, Simon and Carlson, Marc and Carvalho, Benilton S and Bravo, Hector Corrada and Davis, Sean and Gatto, Laurent and Girke, Thomas and others 2015) object for downstream analysis. For the moment this function is working only with data level 3.

The arguments are:

- query Data frame as the one returned from TCGAquery
- dir Directory with the files
- type File to prepare.
- save Save a rda object with the prepared object? Default: FALSE
- filename Name of the rda object that will be saved if save is TRUE
- toPackage Name of the package to prepare the data specific to that package.
- summarizedExperiment Should the output be a SummarizedExperiment object? Default: TRUE

#### **Example of use**

```
# get all samples from the query and save them in the TCGA folder
# samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results
# samples to normalize later
data <- TCGAprepare(query, dir = "data", save = TRUE, filename = "myfile.rda")</pre>
```

As an example, for the platform IlluminaHiSeq\_RNASeqV2 we prepared two samples (TCGA-DY-A1DE-01A-11R-A155-07 and TCGA-DY-A0XA-01A-11R-A155-07) for the rsem.genes.normalized\_results type. In order to create the object mapped the gene\_id to the hg19. The genes\_id not found are then removed from the final matrix. The default output is a SummarizedExperiment is shown below.

```
data

```

In order to create the SummarizedExperiment object we mapped the rows of the experiments into GRanges. In order to map miRNA we used the miRNA from the anotation database TxDb.Hsapiens.UCSC.hg19.knownGene, this will exclude the miRNA from viruses and bacteria. In order to map genes, genes alias, we used the biomart hg19 database (hsapiens\_gene\_ensembl from grch37.ensembl.org).

In case you prefere to have the raw data. You can get a data frame without any modification setting the summarizedExperiment to false.

- **genome\_wide\_snp\_6**: hg18.seg,hg19.seg,nocnv\_hg18.seg,nocnv\_hg19.seg

#### Preparing the data with TCGAprepare - toPackage

This section will show how to integrate TCGAbiolinks with other packages. Our intention is to provide as many integrations as possible.

The example below shows how to use TCGAbiolinks with ELMER package (expression/methylation analysis). The TCGAprepare for the methylation data will Removing probes with NA values in more than 0.80% samples and remove the anottation data, fot the expression data it will take the log2(expression + 1) of the expression matrix in order to To linearize the relation between methylation and expressionm also it will prepare the rownames as the specified by the package.

# Examples TCGAquery, TCGAdownload, TCGAprepare

#### Gene Expression IlluminaHiSeq\_RNASeq

```
You can easily search TCGA samples, download and prepare a matrix of gene expression.
```

#### Gene Expression IlluminaHiSeq\_RNASeqV2

You can easily search TCGA samples, download and prepare a matrix of gene expression.

```
# You can define a list of samples to query and download providing relative TCGA barcodes.
```

#### **CNV**

You can easily search TCGA samples, download and prepare a matrix of gene expression.

# TCGAquery\_clinic & TCGAquery\_clinicFilt: Working with clinical data

You can retrive clinical data using the clinic function. The parameters of this function are:

- cancer ("OV", "BRCA", "GBM", etc)
- clinical\_data\_type ("clinical\_patient", "clinical\_drug", etc)

A full list of cancer and clinical data type can be found in the help of the function.

```
# Get clinical data
clinical_brca_data <- TCGAquery_clinic("brca","clinical_patient")
clinical_uvm_data_bio <- TCGAquery_clinic("uvm","biospecimen_normal_control")
clinical_brca_data_bio <- TCGAquery_clinic("brca","biospecimen_normal_control")
clinical_brca_data <- TCGAquery_clinic("brca","clinical_patient")</pre>
```

Also, some functions to work with clinical data are provided. For example the function TCGAquery\_clinicFilt will filter your data, returning the list of barcodes that matches all the filter.

The parameters of TCGAquery\_clinicFilt are:

- barcode List of barcodes
- clinical\_patient\_data clinical patient data obtained with clinic function Ex: clinical\_patient\_data <- TCGA-query\_clinic("LGG", "clinical\_patient")</li>
- HER her2 neu immunohistochemistry receptor status: "Positive" or "Negative"
- gender "MALE" or "FEMALE"
- PR Progesterone receptor status: "Positive" or "Negative"
- stage Pathologic Stage: "stage\_IX", "stage\_I", "stage\_IA", "stage\_IB", "stage\_IIX", "stage\_IIA", "stage\_IIB", "stage\_IIV" -
- **ER** Estrogen receptor status: "Positive" or "Negative"

# **TCGA Downstream Analysis**

After preparing the gene expression from TCGA data using the TCGAprepare function, you can do a normalization of genes using the function TCGAanalyze\_Normalization, do a quantile filter of genes with the TCGAanalyze\_Filtering function.

TCGAanalyze\_Normalization allows user to normalize mRNA transcripts and miRNA, using *EDASeq* package. Normalization for RNA-Seq Numerical and graphical summaries of RNA-Seq read data. Within-lane normalization procedures to adjust for GC-content effect (or other gene-level effects) on read counts: loess robust local regression, global-scaling, and full-quantile normalization (Risso, Davide and Schwartz, Katja and Sherlock, Gavin and Dudoit, Sandrine 2011). Between-lane normalization procedures to adjust for distributional differences between lanes (e.g., sequencing depth): global-scaling and full-quantile normalization (Bullard, James H and Purdom, Elizabeth and Hansen, Kasper D and Dudoit, Sandrine 2010).

For istance returns all mRNA or miRNA with mean across all samples, higher than the threshold defined quantile mean across all samples.

Also, in order to classify your samples (barcode) you can use the TCGAquery\_SampleTypes function, the typeSample "NT" will return the "Solid Tissue Normal" samples, while the typeSample "TP" will return "Primary Solid Tumor" samples.

```
# Downstream analysis using gene expression data
# TCGA samples from IlluminaHiSeq_RNASeqV2 with type rsem.genes.results
library(TCGAbiolinks)

# dataBRCA in TCGAbiolinks package is a table from TCGA BRCA [10 samples] and comes from
# BRCAMatrix <- TCGAprepare(query, "dataBrca") from above example
# dataBRCA <- BRCAMatrix

# normalization of genes
dataNorm <- TCGAbiolinks::TCGAanalyze_Normalization(dataBRCA, geneInfo)

# quantile filter of genes
dataFilt <- TCGAanalyze_Filtering(dataNorm, 0.25)</pre>
```

```
# selection of normal samples "NT"
samplesNT <- TCGAquery_SampleTypes(colnames(dataFilt), typesample = c("NT"))
# selection of tumor samples "TP"
samplesTP <- TCGAquery_SampleTypes(colnames(dataFilt), typesample = c("TP"))</pre>
```

#### TCGAanalyze\_DEA & TCGAanalyze\_LevelTab Differential expression analysis (DEA)

Perform DEA (Differential expression analysis) to identify differentially expressed genes (DEGs) using the TCGAanalyze\_DEA function.

TCGAanalyze\_DEA performs DEA using following functions from edgeR:

- 1. edgeR::DGEList converts the count matrix into an edgeR object.
- 2. edgeR::estimateCommonDisp each gene gets assigned the same dispersion estimate.
- 3. edgeR::exactTest performs pair-wise tests for differential expression between two groups.
- 4. edgeR::topTags takes the output from exactTest(), adjusts the raw p-values using the False Discovery Rate (FDR) correction, and returns the top differentially expressed genes.

This function receives as parameters:

- mat1 The matrix of the first group (in the example group 1 is the normal samples),
- mat2 The matrix of the second group (in the example group 2 is tumor samples)
- Cond1type Label for group 1
- Cond1type Label for group 2

After, we filter the output of dataDEGs by abs(LogFC) >= 1, and uses the TCGAanalyze\_LevelTab function to create a table with DEGs (differentially expressed genes), log Fold Change (FC), false discovery rate (FDR), the gene expression level for samples in Cond1type, and Cond2type, and Delta value (the difference of gene expression between the two conditions multiplied logFC).

Table 4: Table DEGs after DEA

mRNA	logFC	FDR	Tumor	Normal	Delta

#### TCGAanalyze\_EAcomplete & TCGAvisualize\_EAbarplot: Enrichment Analysis

Researchers, in order to better understand the underlying biological processes, often want to retrieve a functional profile of a set of genes that might have an important role. This can be done by performing an enrichment analysis.

We will perform an enrichment analysis on gene sets using the TCGAanalyze\_EAcomplete function. Given a set of genes that are up-regulated under certain conditions, an enrichment analysis will find identify classes of genes or proteins that are over-represented using annotations for that gene set.

To view the results you can use the TCGAvisualize\_EAbarplot function as shown below.

### TCGAvisualize\_PCA: Principal Component Analysis plot for differentially expressed genes

In order to understand better our genes, we can perform a PCA to reduce the number of dimensions of our gene set. The function TCGAvisualize\_PCA will plot the PCA for different groups.

The parameters of this function are:

- dataFilt The expression matrix after normalization and quantile filter
- dataDEGsFiltLevel The TCGAanalyze\_LevelTab output
- ntopgenes number of DEGs genes to plot in PCA

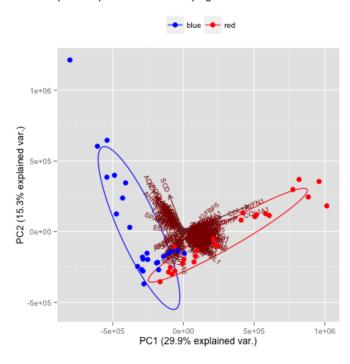

```
library(TCGAbiolinks)
```

```
# normalization of genes
dataNorm <- TCGAbiolinks::TCGAanalyze_Normalization(dataBRCA, geneInfo)

# quantile filter of genes
dataFilt <- TCGAanalyze_Filtering(dataNorm, 0.25)

# Principal Component Analysis plot for ntop selected DEGs
TCGAvisualize_PCA(dataFilt,dataDEGsFiltLevel, ntopgenes = 200)

# boxplot of normalized data
#sampleGenes <- rownames(dataDEGsFilt[dataDEGsFilt$logFC >=1,])[1:20]
#boxplot(log(dataBRCA[sampleGenes,]), las = 2)
#boxplot(log(dataFilt[sampleGenes,]), las = 2)
```

#### PCA top 200 Up and down diff.expr genes between Normal vs Tumor

#### Survival Analysis: TCGAanalyze\_survival, Cox Regression and dnet package

When analyzing survival times, different problems come up than the ones discussed so far. One question is how do we deal with subjects dropping out of a study. For example, assume that we test a new cancer drug. While some subjects die, others may believe that the new drug is not effective, and decide to drop out of the study before the study is finished. A similar problem would be faced when we investigate how long a machine lasts before it breaks down.

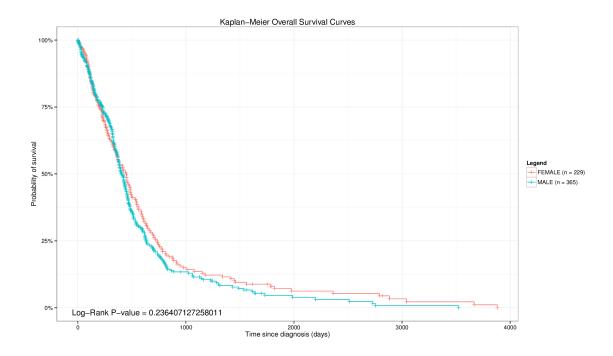

Using the clinical data, it is possible to create a survival plot with the function TCGAanalyze\_survival as follows:

```
# survival using the column group
clinical <- TCGAquery_clinic("gbm","clinical_patient")
TCGAanalyze_survival(clinical,"gender")</pre>
```

The arguments of TCGAanalyze\_survival are:

- clinical\_patient TCGA Clinical patient with the information days\_to\_death
- clusterCol Column with groups to plot. This is a mandatory field, the caption will be based in this column
- legend Legend title of the figure
- **cutoff** xlim This parameter will be a limit in the x-axis. That means, that patients with days\_to\_deth > cutoff will be set to Alive.
- main main title of the plot
- ylab y-axis text of the plot
- xlab x-axis text of the plot
- filename The name of the pdf file
- color Define the colors of the lines.

```
## Warning in readPNG("survival.png"): libpng warning: iCCP: profile 'icc':

#### **TCGA** downstream methylation analysis

Some downstream analysis from methylation data can be done with TCGAbiolinks. An example is shown below. Firstly, we search, download and prepare data from the HumanMethylation450 platform for the GBM tumor and also get the

clinical information from the patients. In this step, we will have a SummarizedExperiment object, where the rows are the probes and the columns the samples. For more information about this object you can take a look in the documentation with the command ?SummarizedExperiment.

```
library(TCGAbiolinks)
# Getting the data
query <- TCGAquery(tumor = "gbm", platform = "HumanMethylation450", level = 3)
TCGAdownload(query,path=".")
data <- TCGAprepare(query = query,dir = ".",save = T)</pre>
clinical <- TCGAquery_clinic("gbm","clinical_patient")</pre>
#Preprocessing
## We will remove probes with NA level
data <- subset(data, subset=(rowSums(is.na(assay(data)))==0))</pre>
# For the analysis we remove X and Y chromosome, because gender
# should not influentiate the analysis
# We will remove the rs probes that should not be used in the methylation analysis
idx <- !(grepl("chrX|chrY|chrNA",as.vector(seqnames(data))))</pre>
data <- subset(data, subset=idx)</pre>
As an example, we divided the data into groups in order to analyze the data.
# random split of pacients into groups
clinical$group <- c(rep("group1",nrow(clinical)/4),</pre>
                     rep("group2",nrow(clinical)/4),
                     rep("group3",nrow(clinical)/4),
                     rep("group4",nrow(clinical)-3*(floor(nrow(clinical)/4))))
 colData(data)$group <- c(rep("group1",ncol(data)/2), rep("group2",ncol(data)/2))</pre>
```

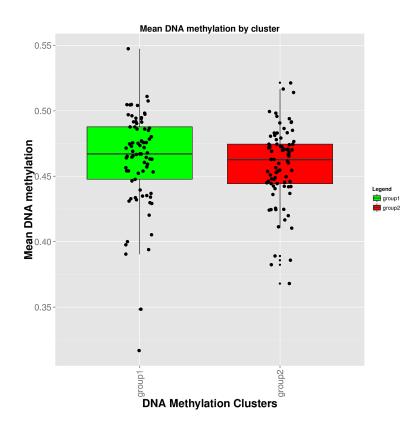

#### TCGAvisualize\_meanMethylation: Mean Methylation Analysis

Using the data and calculating the mean methylation per group, it is possible to create a mean methylation boxplot with the function TCGAvisualize\_meanMethylation as follows:

```
TCGAvisualize_meanMethylation(data, "group")
```

The arguments of TCGAvisualize meanMethylation are:

- data SummarizedExperiment object obtained from TCGAprepare
- groupCol Columns in colData(data) that defines the groups. If no columns defined a columns called "Patients" will be used
- sort Sort by mean methylation? False by default
- filename The name of the pdf that will be save
- legend Legend title of the figured
- ylab y-axis text of the plot
- xlab x-axis text of the plot
- filename The name of the pdf file
- color Define the colors of the lines.

#### TCGAanalyze\_DMR: Differentially methylated regions Analysis

We will search for differentially methylated CpG sites using the TCGAanalyze\_DMR function. In order to find these regions we use the beta-values (methylation values ranging from 0.0 to 1.0) to compare two groups.

Firstly, it calculates the difference between the mean methylation of each group for each probes.

Secondly, it calculates the p-value using the wilcoxon test adjusting by the Benjamini-Hochberg method. The default parameters was set to require a minimum absolute beta-values difference of 0.2 and a p-value adjusted of < 0.01.

After these analysis, we save a volcano plot (x-axis:diff mean methylation, y-axis: significance) that will help the user identify the differentially methylated CpG sites and return the object with the calculus in the rowRanges.

data <- TCGAanalyze\_DMR(data,groupCol="group")</pre>

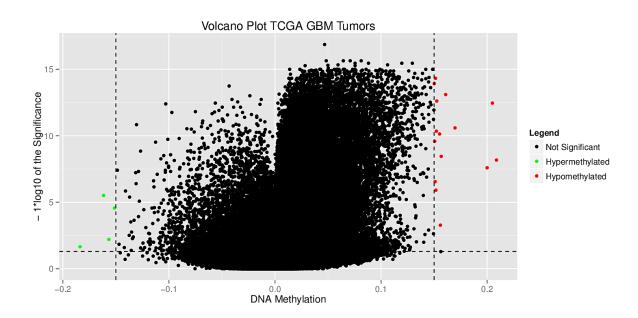

Volcano plot saved and the given data with the results (diffmean.group1.group2,p.value.group1.group2, p.value.adj.group1.group2,status.group1.group2) in the rowRanges where group1 and group2 are the names of the groups

The output will be an graph such as the figure below. Also, the TCGAanalyze\_DMR function will return the Summarized-Experiment with the values of p-value, p-value adjusted, diffmean and the group it belongs in the graph (non significant, hypomethylated, hypermethylated). This values can be view/acessed using the rowRanges acessesor.

The arguments of volcanoPlot are:

- data SummarizedExperiment object obtained from TCGAprepare
- groupCol Columns in colData(data) that defines the groups. If no columns defined a columns called "Patients" will
  be used
- group1 In case our object has more than 2 groups, you should set the name of the group
- group2 In case our object has more than 2 groups, you should set the name of the group
- **filename** The name of the pdf that will be save
- **legend** Legend title of the figured
- ylab y-axis text of the plot

- xlab x-axis text of the plot
- filename The name of the pdf file
- color Define the colors of the lines.
- label vector of labels to be used in the figure
- xlim x limits to cut image
- ylim y limits to cut image
- p.cut p values threshold
- diffmean.cut diffmean threshold
- paired Wilcoxon paired parameter
- adj.method Adjusted method for the p-value calculation

#### TCGAvisualize\_starburst: Analyzing expression and methylation together

The starburst plot is proposed to combine information from two volcano plots, and is applied for a study of DNA methylation and gene expression. In order to reproduce this plot, we will use the TCGAvisualize\_starburst function.

The function creates Starburst plot for comparison of DNA methylation and gene expression. The log10 (FDR-corrected P value) is plotted for beta value for DNA methylation (x axis) and gene expression (y axis) for each gene. The black dashed line shows the FDR-adjusted P value of 0.01.

The parameters of this function are:

- met SummarizedExperiment with methylation data obtained from the TCGAprepare and processed by volcanoAnalysis function. Expected colData columns: diffmean, p.value.adj and p.value
- exp SummarizedExperiment with methylation data obtained from the TCGAprepare function and processed by TCGAanalyze\_DEA function. Expected colData columns: diffmean, p.value.adj and p.value
- group1 Name of the group1
- group2 Name of the group2
